

**WEARABLE PHONE AND WRISTWATCH HAVING A DETACHABLE PHONE
MODULE AND A SEPARATE PHONE CARRIAGE**

ABSTRACT

5 The present invention relates to a phone module contained within a wristphone unit that can be inserted into a supporting watchband style carriage, or removed and inserted in a conventional cell phone style carriage. Other features can include speaker and microphone components in both the watch carriage and the cell phone carriage, allowing smaller components to be used in the wrist-worn configuration. Other features may be separated from the core phone module such as a numeric keypad.
